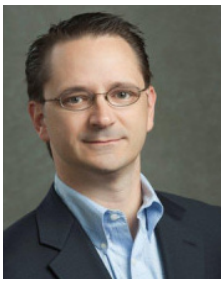
PEDO/ORTHO - Interceptive Orthodontic Techniques *Basic for Airway & Facial Development*

Interceptive Orthodontic Treatment is any orthopedic/orthodontic treatment performed between the ages of three and eleven years. It is also referred to as Early Phase Orthodontics or Phase I Orthodontics. The primary purpose of Interceptive Orthodontics is to fully develop the middle and lower facial thirds, which provides stable healthy function and best esthetic result possible. Developing a proper airway with normal nasal breathing, avoiding surgical orthodontics, and guaranteeing non-extraction orthodontics at a later age are three of the many benefits of Interceptive Orthodontics.



SPEAKER Dr. Ben Miraglia graduated from the State University of New York at Buffalo School of Dental Medicine and completed a general practice residency program at Danbury Hospital in Connecticut. He has 22 years private practice experience in Mt. Kisco, New York, where his focus has been on early childhood growth and development. Dr. Miraglia is a graduate of the United States Dental Institute where he learned his non-extraction and non-surgical orthodontic philosophy. Dr. Miraglia lectures nationally on childhood sleep disordered breathing and its impact on the development of the maxilla, mandible and airway.
Dr. Miraglia holds faculty positions with Align Technology and the United States Dental Institute and is on the Board of Directors of the American Academy of Cosmetic Orthodontics as well as the American Academy of Physiological Medicine and Dentistry. Dr. Miraglia was recently honored with a position on the President's Council of Northern Westchester Hospital in Mt. Kisco, New York.

Academy of General Dentistry
PACE
